What is MatchFlix? 🤔

Don't know what to watch? Use MatchFlix to swipe left or right on movies you like or don't like and let our algorithm recommend the perfect movie for your night! Too tired to swipe? Check out our discover page to browse several movies of all genres!

Challenges of MatchFlix

- Clashing Principles
 - Over the course of our project we had several different visions for implementing our features that at times cost us time by making new versions of code. Once we realized some of us we're clashing heads with ideas we got together and talked out the vision we all saw together.
- Scope Creep
 - Over the time of the project slowly realized that some of our features were too advanced for the given time we had. As a team we discussed that this won't be a viable option anymore and came up with new and simpler features that still greatly enhanced MatchFlix
- GitHub Repo Issues
 - Over the course of the project we had several merge conflicts to the point where we lost code and had to go back commits. But as the project went on we learned how to better communicate about the code that we were working on, and improved on reducing the amount of merge conflicts

What could make MatchFlix even better?

- User Sessions
 - We discussed over the time of the project about implementing some sort of session where 2 users can join and swipe together to find which movie interests both users
- Friend Network
 - The ability to see other people's liked and disliked movies would be a fun feature and adds a social aspect to the app
- Search Bar
 - One implementation that would be interesting would be a search bar in the navbar to find movies, or users.

Tools we used to create MatchFlix

GitHub - ★★★★★ (5)

PostgreSQL - ★★★★★ (5)

VSCode - ★★★★★ (5)

Figma - ★★★★★ (5)

NodeJS - ★★★★★ (4)

Render - ★★★★★ (3)

TMDB - ★★★★★ (4)

Gemini - ★★★★★ (5)

Mocha - ★★ (2)

Agile - ★★★ (3)
